-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 18 May 2007.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-24, 26-31 and 33-36 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-24, 26-31 and 33-36 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

This action is in response to the amendment filed on May 18, 2007.

#### ***Response to Amendment***

The affidavit filed on May 18, 2007 under 37 CFR 1.131 has been considered but is ineffective to overcome the Raese (US 6700853) reference.

The evidence submitted is insufficient to establish diligence from a date prior to the date of reduction to practice of the Raese (US 6700853) reference to either a constructive reduction to practice or an actual reduction to practice. According to the MPEP, "Where conception occurs prior to the date of the reference, but reduction to practice is afterward, it is not enough merely to allege that applicant or patent owner had been diligent. *Ex parte Hunter*, 1889 C.D. 218, 49 O.G. 733 (Comm'r Pat. 1889). Rather, applicant must show evidence of facts establishing diligence. What is meant by diligence is brought out in *Christie v. Seybold*, 1893 C.D. 515, 64 O.G. 1650 (6th Cir. 1893). ....An applicant may be diligent within the meaning of the patent law when he or she is doing nothing, if his or her lack of activity is excused. Note, however, that the record must set forth an explanation or excuse for the inactivity; the USPTO or courts will not speculate on possible explanations for delay or inactivity. See *In re Nelson*, 420 F.2d 1079, 164 USPQ 458 (CCPA 1970). Diligence must be judged on the basis of the particular facts in each case. See MPEP § 2138.06 for a detailed discussion of the diligence requirement for proving prior invention." See MPEP 715.07 (a).

In the instant case, Applicant has presented a lack of evidence to support due diligence for at least the period between July 25, 2001 (Contacting counsel) to July 24, 2002 (Transfer of file letter).

The affidavit filed on May 18, 2007 under 37 CFR 1.131 has been considered but is ineffective to overcome the Marshall reference (US 2002/0122373) which has a publication date of 9/5/2002. The Marshall '373 reference is a statutory bar under 35 U.S.C. 102(b) and thus cannot be overcome by an affidavit or declaration under 37 CFR 1.131.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

The applied reference has a common assignee with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention “by another,” or by an appropriate showing under 37 CFR 1.131.

Claims 1-2, 22, 24 and 36 are rejected under 35 U.S.C. 102(e) as being anticipated by Raese (US 6700853).

Regarding claim 1, Raese discloses a semiconductor memory comprising: a controller (1000, fig. 11); a media including first information (fig. 7); and first read/write mechanism including an electron field emitter (fig. 10), configured to read the first information (col. 7 lines 1-6); wherein the controller is configured to receive a first signal generated in response to the

Art Unit: 2627

first information being read, and wherein the controller is configured to generate a second signal configured to cause a position of the media to be adjusted relative to the electron field emitter in response to the first signal (col. 7 lines 1-6).

Regarding claim 2, Raese further discloses wherein the first information comprises position information (col. 7 lines 1-6).

Regarding claim 22, Raese discloses an atomic resolution storage device comprising: a media including servo information; (100, fig. 10 and 740, fig. 7) a field emitter associated with the media, configured to read the servo information (1002, fig. 10); wherein the controller is configured to receive a first signal generated in response to the servo information being read, and wherein the controller is configured to generate a second signal (col. 7 lines 1-6); a mover configured to adjust the position of the media relative to field emitter in response to the second signal (col. 7 lines 1-6 and 1121 fig. 1) .

Regarding claims 24 and 36, Raese discloses a system for storing and retrieving information comprising: semiconductor media for storing and retrieving data (fig. 1); a read/write mechanism movable relative to said media for writing data to and reading data from said media; means for positioning said read/write mechanism relative to said media (112, fig. 1); and control-code stored on said media for controlling said means for positioning said read/write mechanism (col. 7 lines 1-6).

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person

Art Unit: 2627

having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-25, 27-31 and 33-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Marshall (US 2002/0122373) in view of Guzik et al (US 2002/0114101).

Regarding claim 1, Marshall discloses a semiconductor memory comprising: a controller (fig. 2); a media including first information (fig. 7); and first read/write mechanism including an electron field emitter (fig. 15), configured to read the first information (par. 31). Marshall further discloses wherein the controller controls the movement of the medium to create any desired read/write path (par. 66). Marshall fails to disclose wherein the controller is configured to receive a first signal generated in response to the first information being read, and wherein the controller is configured to generate a second signal configured to cause a position of the media to be adjusted relative to the electron field emitter in response to the first signal. In the same field of endeavor, Guzik discloses using a servo burst to adjust the position of the medium and the recording source (par.66). It would have been obvious to one of ordinary skill in the art to modify the storage device disclosed by Marshall in order to provide information on the medium for generating a positioning signal as taught by Guzik. The rationale is as follows: One of ordinary skill in the art would have been motivated to generate positioning adjustment signal from information on a semiconductor memory in order to adjust the 'tracking error' of the read/write means with respect to the data bits on the memory.

Regarding claim 2, Guzik further discloses wherein the first information comprises position information (59, fig. 3).

Regarding claim 3, Marshall discloses wherein the first information comprises timing information (par. 66). Guzik further discloses wherein the first information comprises timing information (par. 60).

Regarding claim 4, Marshall disclose a mover configured to move the position of the media relative to the read/write mechanism in response to a control signal (par. 69 and par. 89 and fig. 14). Guzik discloses a mover configured to adjust the position of the media relative to the first read/write mechanism in response to the second signal (par. 64). The rationale for combining Marshall and Guzik follows as in claim 1.

Regarding claim 5, Marshall discloses a second read/write mechanism configured to read information from the media (par. 37); wherein the mover is configured to adjust the position of the media relative to the second read/write mechanism in response a control signal (pars. 37-38). Guzik discloses wherein multiple areas of second information (burst information) are stored within the storage medium (par. 62).

Regarding claim 6, Marshall discloses wherein the controller is configured to generate a third signal configured to cause a timing window to be generated wherein a timing signal is generated in response to the first signal (par. 66). Guzik discloses wherein a timing signal is generated in response to the burst information (par. 63).

Regarding claim 7, Marshall further discloses a read/write mechanism configured to read second information from the media during the timing window (par. 66).

Regarding claim 8, Marshall further discloses a read/write mechanism configured to write second information to the media during the timing window (par. 66).

Art Unit: 2627

Regarding claim 9, Marshall discloses a method of reading information from a semiconductor storage device comprising: reading first information from a media in the semiconductor storage device (par. 66); generating a first signal in response to reading the first information (par. 39); and generating a second signal (110, fig. 2 and pars. 48 and 57), the second signal configured to cause second information to be read from the media during a first time period (par. 66). Marshall fails to disclose wherein the second signal is generated from the first information read from the medium. In the same field of endeavor, Guzik discloses generating a second signal including timing information from first information read from a medium (par. 60). It would have been obvious to one of ordinary skill in the art to modify the method disclosed by Marshall by generating the timing signal from the first information read from the medium as taught by Guzik. The rationale is as follows: One of ordinary skill in the art at the time of the applicant's invention would have been motivated to generate the timing signal from the first information on the medium in order to generate a reproduction signal that is in phase with the bits on the medium.

Regarding claim 10, Marshall further discloses reading the second information from the media during the first time period (par. 37).

Regarding claim 11, Guzik discloses reading the first information from a first cluster on the media (par. 62); and reading the second information from a second cluster on the media during the first time period (pars. 66-67). Marshall discloses wherein the information is read based on the equations in par. 48 and par. 57, which in combination with Guzik are set using the timing information generated from the first information.

Regarding claims 12 and 13, Marshall discloses wherein the second signal is configured to cause third information to be written to the media during a second time period (pars. 48-64). Marshall discloses wherein the timing windows are based on the arbitrary phase components of the equations in paragraphs 48 and 57. The combination of Marshall and Guzik selects the timing windows based on the generated timing signals as taught by Guzik (par. 60).

Regarding claim 14, Guzik further discloses reading the first information from a first cluster on the media ('servo bursts', par.66). Marshall discloses writing the second information to a second cluster on the media during the second time period (par. 66, fig. 1d and par. 44).

Regarding claim 15, Marshall discloses generating a third signal, the third signal configured to cause a position of the media to be adjusted relative to a read/write mechanism (110, fig. 2 and pars. 48 and 57). Guzik discloses wherein the third signal is generated from the first information (burst information, par. 64). It would have been obvious to one of ordinary skill in the art to modify the method disclosed by Marshall by generating a third signal based on first information read from the medium as taught by Guzik.. The rationale is as follows: One of ordinary skill in the art at the time of the applicant's invention would have been motivated to modify the method disclosed by Marshall in order to generate a third signal based on first information in order to produce a tracking error signal from the reproduced information.

Regarding claims 16, Marshall discloses an atomic resolution storage device comprising: a media that includes a first cluster and a second cluster (par.43), the first cluster including first information (par. 39); first means for generating timing information (110D, fig. 2 and par. 66); and second means for writing second information in the second cluster using the timing

Art Unit: 2627

information (pars. 37 and 66). Marshall discloses that the controller 110D generates timing windows for writing to the different clusters or arrays on the medium. Marshall fails to disclose where the timing windows are generated from the first information read from the medium. In the same field of endeavor, Guzik discloses servo burst information that contains timing information (par. 60). It would have been obvious to one of ordinary skill in the art to modify the storage device disclosed by Marshall in order to provide timing information on the medium as taught by Guzik. The rationale is as follows: One of ordinary skill in the art at the time of the applicant's invention would have been motivated to provide timing information on the medium in order to read/write information at a proper bit density and phase such that jitter error is minimized.

Regarding claim 17, Marshall further discloses third means for reading third information from the second cluster using the timing information (par. 37). Marshall discloses a plurality of arrays or clusters and a plurality of means for reading and writing to the arrays using the timing information generated by the controller 110D.

Regarding claim 18, Marshall further discloses third means for generating position information (110D, fig. 2 and par. 44); and fourth means for adjusting the media relative to the second means in response to the position information (110C, fig. 2 and par. 44). Marshall fails to disclose wherein the position information is generated from the first information. Guzik further discloses that the burst information is used to generate a signal to adjust the position of the medium relative to the head (par. 64). It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the storage device disclosed by Marshall in order to provide information on the medium for generating a

Art Unit: 2627

positioning signal as taught by Guzik. The rationale is as follows: One of ordinary skill in the art would have been motivated to generate positioning information from information on a storage device in order to adjust the 'tracking error' of the read/write means and the data bits.

Regarding claim 19, Marshall further discloses wherein the second cluster includes a plurality of patches, wherein each of the plurality of patches includes a plurality of tracks, and wherein the second means is for writing the second information to one of the plurality of tracks (135A, 135B, fig. 2 and par. 66).

Regarding claim 20, Marshall further discloses wherein the position information indicates a position of the second means relative to the one of the plurality of tracks (par. 44).

Regarding claim 21, Marshall further discloses wherein the fourth means is for adjusting the media relative to the second means in response to the position information to align the second means with a center of the one of the plurality of tracks (par. 44 and fig. 14). Guzik further discloses that a tracking error signal is generated from the first information for positioning the head at the center of the track (par. 60).

Regarding claim 22, Marshall discloses an atomic resolution storage device comprising: a media including information (fig. 1d); a field emitter associated with the media, configured to read the information (par. 39); wherein a controller is configured to receive a first signal (110D, fig. 2); the controller being configured to generate a second signal (110E, 110F, fig. 2); a mover configured to adjust the position of the media relative to field emitter in response to the second signal (par. 44). Marshall fails to disclose wherein the information is servo information, and wherein the position signal is generated from the servo information. In the same field of endeavor, Guzik discloses servo burst information recorded on a medium, wherein position

Art Unit: 2627

information is generated from the servo burst information (par. 60). It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the storage device disclosed by Marshall in order to provide information on the medium for generating a positioning signal as taught by Guzik. The rationale is as follows: One of ordinary skill in the art would have been motivated to generate positioning information from information on a storage device in order to adjust the 'tracking error' of the read/write means and the data bits.

Regarding claim 23, Marshall discloses a second field emitter configured to read second information from the medium (par. 44) and wherein the controller is configured to adjust the position of the medium relative to the second field emitter in response to the second signal (par. 44 and fig. 2). Guzik discloses wherein the information is servo information as applied above, and that the medium can contain a plurality of servo burst information areas (par. 62).

Regarding claims 24 and 30, Marshall discloses a system for storing and retrieving information comprising: semiconductor media for storing and retrieving data (fig. 7); a read/write mechanism movable relative to said media for writing data to and reading data from said media (fig. 15); means for positioning said read/write mechanism relative to said media (par. 66 and 110D, fig. 2). Marshall fails to disclose control-code stored on said media for controlling said means for positioning said read/write mechanism. In the same field of endeavor, Guzik discloses servo burst information recorded on a medium, wherein position information is generated from the servo burst information (par. 60). It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the storage device disclosed by Marshall in order to provide servo information information on the medium for generating a positioning signal as taught by Guzik. The rationale is as follows: One of ordinary

skill in the art would have been motivated to generate positioning information from information on a storage device in order to adjust the 'tracking error' of the read/write means and the data bits.

Further regarding claim 30, Marshall further discloses a means for timing said read/write mechanism (par. 66).

Regarding claim 25, Guzik further discloses wherein control-code includes code for controlling timing of said read/write mechanism (par. 66). Marshall discloses wherein the controller is used to control timing (par. 66)

Regarding claims 27 and 33, Guzik further discloses wherein said control-code is written in tracks (fig. 9).

Regarding claims 28 and 34, Marshall further discloses wherein said means for positioning positions said read/write mechanism on said tracks (Par. 44 and fig. 14).

Regarding claims 29 and 35, Guzik further discloses wherein said means for positioning positions said read/write mechanism between said tracks to detect a signal of equal amplitude from each track (par. 10 and fig. 6). It would have been obvious to detect the signal of equal amplitude from each servo bit in order to properly center the head on the track and correct for the tracking error. The rationale for combining Marshall and Guzik follows as in claim 24.

Regarding claim 31, Guzik further discloses wherein said read/write control-code includes code for controlling a position of said read/write mechanism (59, fig. 3).

Regarding claim 36, Marshall discloses a method for storing and retrieving information including the steps of providing semiconductor media for storing and retrieving data (fig. 7); providing a read/write mechanism movable relative to said media for writing data to and reading

Art Unit: 2627

data from said media (fig. 15); Marshall fails to disclose control-code stored on said media for controlling said means for positioning said read/write mechanism. In the same field of endeavor, Guzik discloses servo burst information recorded on a medium, wherein position information is generated from the servo burst information (par. 60). It would have been obvious to one of ordinary skill in the art at the time of the applicant's invention to modify the storage device disclosed by Marshall in order to provide servo information information on the medium for generating a positioning signal as taught by Guzik. The rationale is as follows: One of ordinary skill in the art would have been motivated to generate positioning information from information on a storage device in order to adjust the 'tracking error' of the read/write means and the data bits.

### ***Response to Arguments***

Applicant's arguments, see page 9, filed 5/18/2007, with respect to the 35 U.S.C. 112, first paragraph, rejection of claims 24-36 and the amendment filed concurrently have been fully considered and are persuasive. The 35 U.S.C. 112, first paragraph, rejection has been withdrawn.

Applicant's arguments regarding the 37 C.F.R. 1.131 Affidavit have been fully considered but they are not persuasive as discussed above.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tawfik Goma whose telephone number is (571) 272-4206. The examiner can normally be reached on 8:30 am - 5:00 pm.

Art Unit: 2627

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Korzuch can be reached on (571) 272-7589. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
